

# Audit, analyze and report on the security of OpenVMS systems

## PointAudit™ from PointSecure

PointAudit is a non-intrusive PC-based auditing tool that allows users to quickly and easily assess the security and settings of their OpenVMS environment.

### PointAudit

PointAudit helps to improve security and ensure compliance with regulatory and data security requirements such as Sarbanes-Oxley, GLBA, HIPAA, and Basel II by providing customizable, low-impact auditing and reporting on settings across multiple OpenVMS systems. By looking at file security, system settings and user profiles, PointAudit enables users to determine if their OpenVMS security settings are in compliance with defined OpenVMS security policies or industry best practices.

Given the varied and complex methods for granting access on OpenVMS systems, it is virtually impossible to manually determine a users' rights across the system. PointAudit does this for you, answering the important questions such as "Who has what privileges, what are the protections on my sensitive files, and what are the current parameters for my key security settings?" PointAudit provides a comprehensive, automated solution for auditing, analyzing, and reporting on OpenVMS security risks and vulnerabilities, and easily demonstrate compliance with security policies and government regulations.

PointAudit also goes beyond simply auditing by providing mechanisms to remediate vulnerabilities as well as allows you to perform a baseline analysis or compare data collections over time to quickly identify unwanted changes.

### Product Highlights

- ➔ Evaluate state of security across all OpenVMS systems
- ➔ Analyze user privileges, access rights, file protections and system settings
- ➔ Track compliance with corporate policies and regulatory guidelines
- ➔ Identify security exposures and common vulnerabilities
- ➔ Stay abreast of changes to the system and your security model
- ➔ Comprehensive reporting to satisfy audit requirements
